

High resolution imaging of mutual events of the Jupiter moons.

Presented by John Sussenbach (NL) at ESOP XXXV, Guildford, UK on 2016 August 19-21

John Sussenbach and Willem Kivits

Triple shadow transit 12 October 2013

Every 5.93 years the Earth moves through the equatorial plane of Jupiter and its moons

This leads to mutual occultations and eclipses of these moons.

The Galilean moons

Io
1.15"

Europa
0.99"

Ganymede
1.67"

Callisto
1.52"

1. The observers

Willem Kivits: 20 inch Newtonian

John Sussenbach: C14

2. Procedures

Equipment

- *Telescopes:* C14 f/25 - f/40 (JS en WK)
Newtonian 20 inch (WK)
- *Camera's:* QHY5LII (CMOS)
DMK618 (Sony ICX618 chip)
- *IR filter:* 685 nm

Processing of the frames

- *centre with PIPP*

(<https://sites.google.com/site/astropipp>)

- *preprocessing with Photoshop*

- *(hand selection)*

- *final processing with Autostakkert! and Photoshop*

High resolution imaging of Ganymede

Ganymede 01 January 2015 01.06 UT North up
C14 f/28, QHY5LII camera and Baader IR filter

John Sussenbach

Resolution: 0.1"

3. Occultations

Conjunction of Ganymede and Europa 1 Januari 2015
