

VLF flare activity 2005/19.

After the brief spell of activity in January, the sun remained mostly spotless through February with just a few very minor flares shown in the GOESS data. An A1.1 flare is shown on the 8th, and an A9.7 on the 20th. As AR12733 faded at the end of January, the background X-ray flux dropped below the A1 level, rising just a little over the 13th and 14th. It then fell back even further, dropping off the bottom of the published charts (a decade below A1) by the 25th.

The usually reliable 23.4kHz signal (DHO38) was off-air for most of the month with just a few periods of sporadic activity, mostly at night. There is a suggestion that a new signal at 36kHz may be a replacement, but as these signals are not there for our benefit we will have to wait and see what happens. Reports from observers using spectrum lab at this higher frequency will be very welcome.

MAGNETIC OBSERVATIONS.

The active period recorded on January 31st was followed by more a more gentle disturbance on February 1st and 2nd, shown in the chart by Roger Blackwell:

Activity faded early in the morning of the 3rd, with a further brief disturbance late on the 4th. The patchy coronal holes responsible for this activity made a return appearance at the end of the month:

The first recording is again by Roger Blackwell (Isle of Mull) showing two days of activity, while the second is by Colin Clements (Lisburn) showing a close-up of the most active period in the evening of the 28th.

Further patchy coronal holes resulted in some very minor disturbances over the 6th to 8th of February, as recorded by Roger Blackwell:

This was the strongest disturbance of the three days, but is clearly very minor and of short duration.

Magnetic observations received from Colin Clements, Roger Blackwell and John Cook.
