VLF flare activity 2005/19.

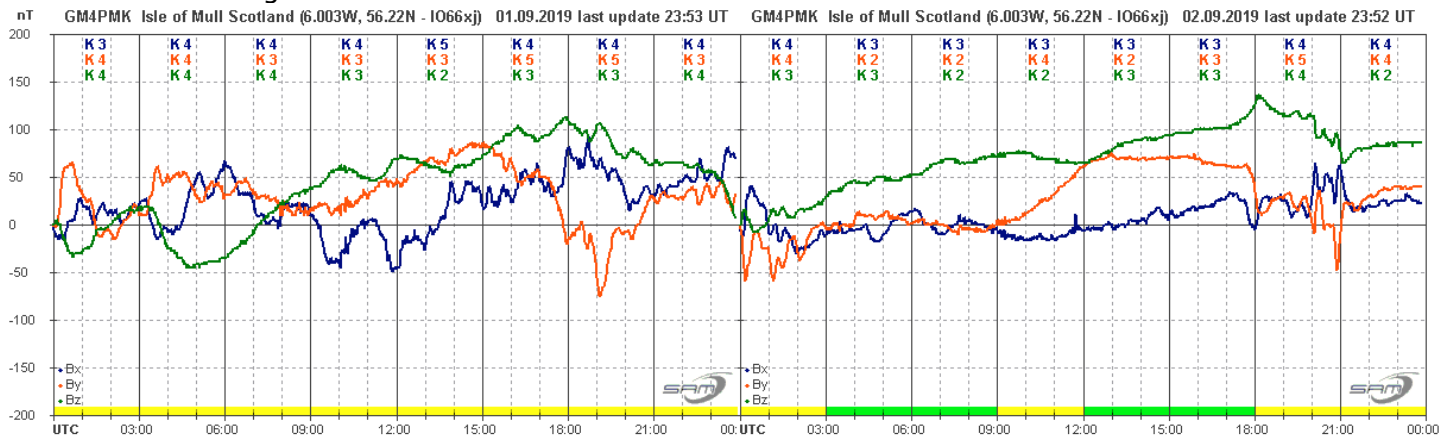

C M X — Relative sunspot number

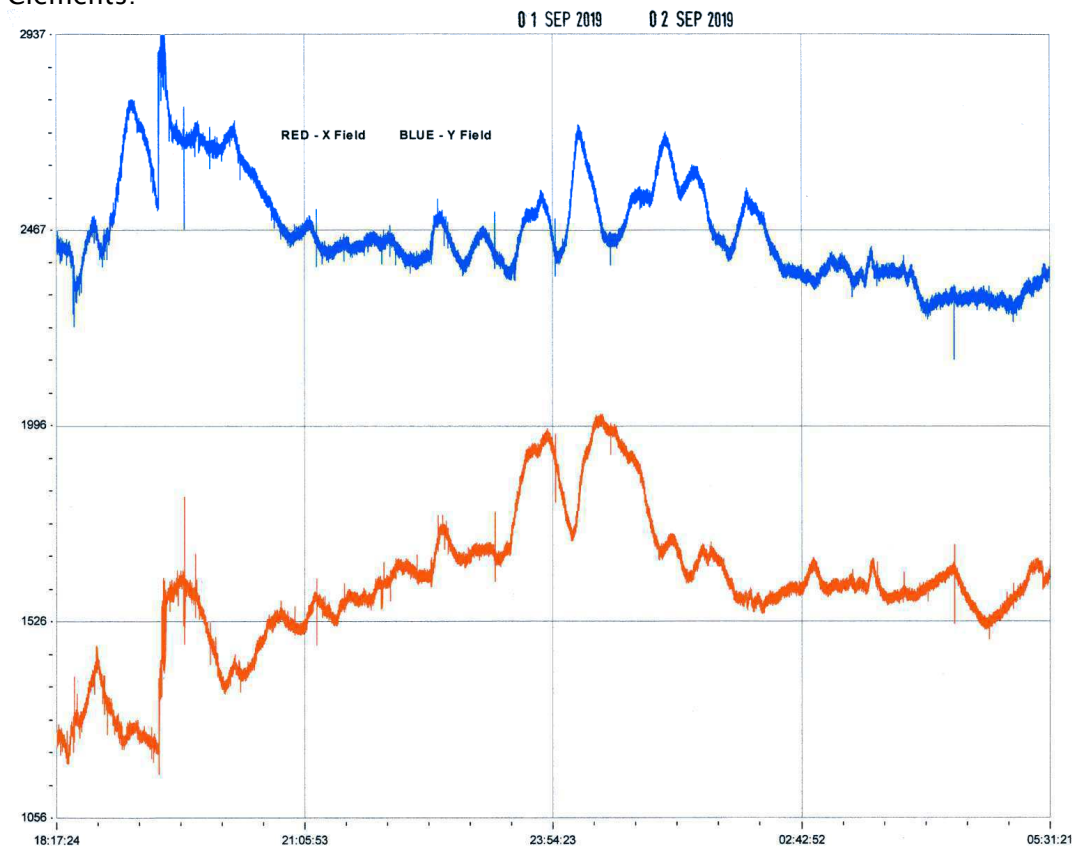

For the fourth month in a run, we have not recorded any SIDs in September. The X-ray flux recorded by the GOES satellite again shows a mostly flat response, the only flares being very small A-class. Colin Clements recorded a sharp rise in 151MHz noise from 15:10 to 16:15UT on the 27th, although its source is not clear.

MAGNETIC OBSERVATIONS.

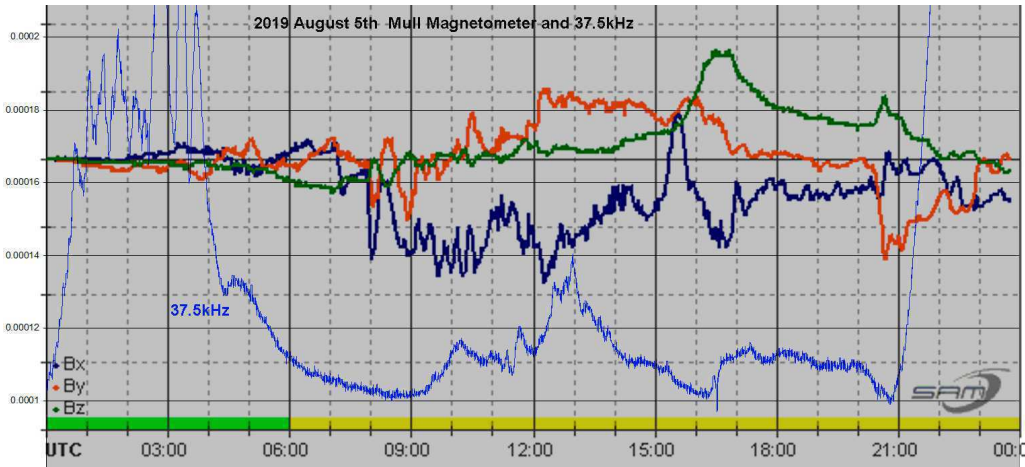

The strong magnetic disturbance at the end of August continued into September, as shown in Roger Blackwell's recording:

This activity had died out by 03UT on the 3rd, but then picked up again over the 4th and 5th with a disturbance of +/-50nT recorded by Roger. The evening of the 1st and morning of the 2nd was also well recorded by Colin Clements:

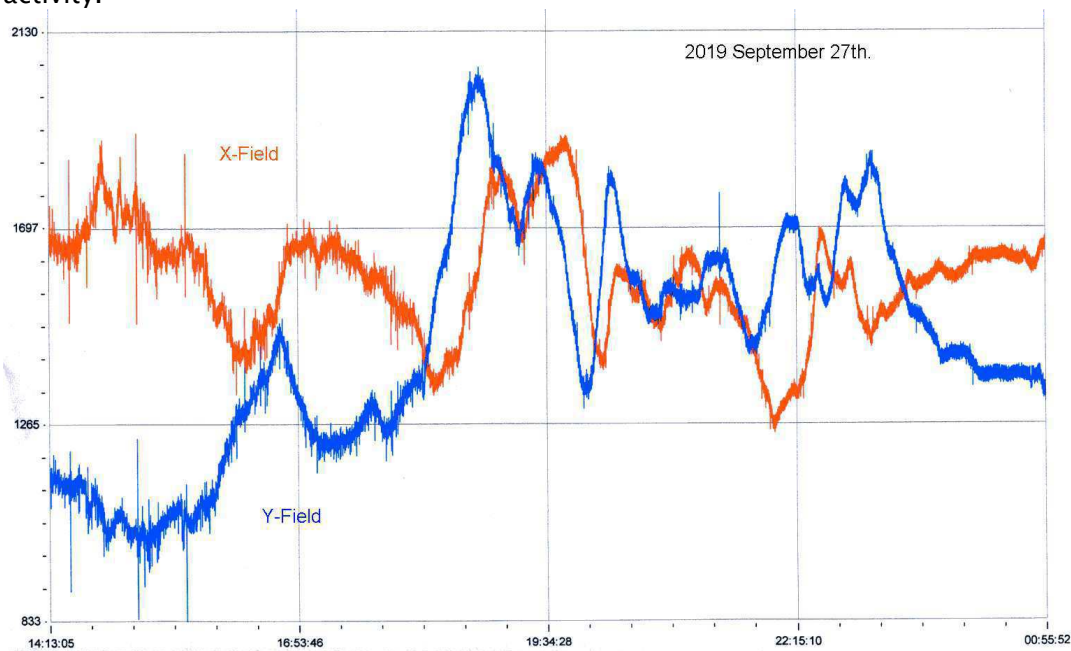

Magnetically induced disturbances on the 37.5kHz signal from Grindavik also continued into September, with some strong effects on the 5th, recorded by Mark Edwards:

Mark has overlaid the 37.5kHz signal (light blue) onto the Mull magnetometer recording of Roger Blackwell.

The same coronal hole made yet another appearance at the end of September, with some more strong activity.

This recording by Colin Clements shows the activity starting in the early evening of the 27th. Activity continued through the 28th, but was much weaker on the 29th, returning more strongly on the 30th. Matching disturbances were again seen on the 37.5kHz signal over the 27th and 28th, while the 30th appeared to also show a possible very small disturbance to the 18.3kHz signal from France.

Increased solar wind speeds led to some minor disturbances on the 9th and 15th to 17th of September. 37.5kHz disturbances were also seen on the 9th, although they did not match the magnetometer as well as usual. Mark noticed that they were a better match with the satellite measurements of the solar wind speed on this occasion.

Magnetic observations received from Colin Clements, Roger Blackwell and John Cook.
